

Learn Path

Build · Deploy — three AI tools, one session

SHIPPED TO

May 2026 · The Trong Nguyen

PART 1 · CLAUDE.AI · Building the app

Help me build a web app called Learn Path — a project learning tracker with AI roadmap generation, daily habit checker, and learn notes with hashtags. Tech: Firebase, Firestore, React. I also have a Google AI Studio API key: AlzaSy...

Turn 1

C Claude

■■ Security flag before we write any code — the API key you just pasted is live and now compromised. Please revoke it in Google AI Studio and generate a new one. The right architecture: your Gemini key lives in a Firebase Cloud Function secret (Google Cloud Secret Manager). It is never sent to the browser. I'll build the backend with that in mind.

Turn 2

— Claude built the working prototype (Turn 3), then iterated 5× on design —

Change the UX to match this reference image [Intellecta dashboard]. Add main dashboard showing all projects. Add project detail with daily log and learn notes — hashtags: #Do / #Don't / #Insight / custom.

Turns 4–8

C Claude

Rebuilt to glassmorphism + gradient mesh matching the reference. Added: multi-project dashboard with progress bars and streaks · project detail with day grid · log panel (what I did + learn notes) · hashtag system with custom tags · notes summary section · responsive layout for mobile and desktop · Poppins + Roboto fonts.

Turns 4–8 output

Package all files for deployment. Also push everything to GitHub: [github.com/thetronnguyen204-stack/Autonomous-Growth-Marketing-Assestment-Learn-Path-project](#)

Turn 9

C Claude

Generated full 20-file Firebase project (React 19 + Vite, Cloud Functions, Firestore rules, deploy config). Created GitHub repo and uploaded all files via API. Also packaged a single markdown prompt-bundle to hand to another AI for deployment.

Turn 10

PART 2 · GEMINI AI · Deployment guide

Help me deploy this app [attached: full 20-file project bundle]

Prompt

G

Gemini

■■ Security note first: if your Gemini API key was shared in chat it is compromised — delete it in Google AI Studio before proceeding. Step 1 — Firebase Console: create project → Firestore (asia-southeast1) → enable Anonymous Auth → register Web app → copy firebaseConfig. Step 2 — Install: npm install (root + functions/) → firebase login → firebase use --add. Step 3 — .env: copy .env.example → .env, fill VITE_FB_ values. Do NOT put the Gemini key here. Step 4 — Secret: firebase functions:secrets:set GEMINI_KEY (encrypts key in Cloud Secret Manager, never exposed to browser). Step 5 — Ship: npm run build → firebase deploy.

Response

PART 3 · CLAUDE CODE CLI · Executing the deployment

help me to deploy this app

Terminal

C

Claude Code

Let me explore the project structure first...

Diagnosing

```
$ firebase --version

15.18.0

$ firebase projects:list

learn-path-3d391 (thetrongnguyen204@gmail.com)
```

C

Claude Code

Wrong account active (nttrong204@gmail.com). Run firebase login:add in a separate terminal to add thetrongnguyen204@gmail.com, then come back.

Account fix

done, switch to thetrongnguyen204@gmail.com

```
$ firebase login:use thetrongnguyen204@gmail.com

+ Set default account thetrongnguyen204@gmail.com

$ firebase use learn-path-3d391

Now using project learn-path-3d391

$ echo "AIzaSy..." | firebase functions:secrets:set GEMINI_KEY

+ Created a new secret version projects/289347860731/secrets/GEMINI_KEY/versions/1

$ npm run build

vite build
```

```
+ dist/ built in 8.42s

$ firebase deploy

+ Hosting: https://learn-path-3d391.web.app

+ Function generateRoadmap deployed

+ Firestore rules updated

✓ Deploy complete!
```
